

KEY BLENNY

Starksia starcki

Order:	Perciformes
Family:	Clinidae
FNAI Ranks:	G1G3/S1
U.S. Status:	None
FL Status:	Species of Special Concern

© Jean Putnam Hancock

Description: A small (.8 - 1.1 in. = 20 - 27 mm) fish with long dorsal and anal fins. Has a pattern of brown bars broken by a horizontal line with tan interspaces as broad as the bars; has single cirrus (fleshy appendage) above each eye and on the nape. Venter (belly) is fully scaled. There are 13 or 14 lateral line scales, 13 pectoral rays, II - 18 or 19 anal rays and XX - 8 or 9 dorsal rays.

Similar Species: In our area, most similar to checkered blenny (*Starksia ocellata*), which has a blotchy or spotted appearance and is slightly larger (average 1.5 in. = 38.1 mm).

Habitat: Little is known, but has been collected in surge channels between rows of coral in waters less than 25 ft (7.6 m) deep. Also collected at a depth of 50 ft. (15 m) in Honduras.

Seasonal Occurrence: Presumed to be present year round.

Florida Distribution: Known only from waters off Looe Key south of Big Pine Key.

KEY BLENNY

Starksia starcki

Range-wide Distribution: Few collections from Florida Keys, Honduras, and Belize.

Conservation Status: Status is undetermined; presumed to be protected by restrictions on coral collecting in Florida reefs.

Protection and Management: Prevent collection of coral; prohibit anchoring over any reefs; improve water quality entering the Florida reef system from Florida Bay.
